

Buckle Up Your Baby... and your toddler... and your teen-ager!

Traffic accidents are the leading cause of childhood death. These deaths CAN be prevented.

Children are NOT safe when:

- sitting on laps.
- standing or kneeling on seats.
- riding in station wagon or pickup cargo areas.
- using inadequate car seats.
- hard, heavy objects are loose in the car.
- playing with sharp objects in a moving car.
- left alone in a car, particularly on hot days.

"Buckling up" prevents human bodies from becoming projectiles in collisions or sudden stops or swerves — causing injury to themselves and others inside the auto.

Infants and small children require a special safety seat or harness to be safe — one designed for children. Begin early — the child will accept the restraint as routine if you begin its use early.

Children over age four (over 40 pounds) should be strapped in. Lap belts fit across hips — not over the belly. Shoulder straps fit across the chest. Use a booster seat if needed.

Consider Before You Buy a Seat:

Examine the seat and carefully read all instructions before buying.

Is it safe? Those listed here are safe. Any seat you buy should have been **dynamically** or **crash** tested.

You must install and use these products **exactly** according to instructions.

Can you afford it? Prices vary, but all are less than ten percent of your car's collision insurance rate. If you buy, comparing prices may help. If price is a problem, consider renting one for a nominal fee from one of the agencies listed.

Will your child use it? That depends on you. Parents must be firm in setting limits, preparing children in a positive way, and setting an example.

Restraints Meeting Federal Safety Standards

JUNE 1983

Brand & Manufacturer	Special Instructions
INFANTS ONLY	
CENTURY Infant Love Seat	Rear-facing only; auto belt loops over frame in front of child.
Deluxe Infant Love Seat	Rear-facing only; auto belt loops over frame in front of child.

UNILANDO/BUNNY BEAR Sweetheart II	Convertible; 5-point harness; auto belt loops through frame behind child.
WELSH Travel Tot	Convertible; 5-point harness; auto belt loops over frame in front of child; mini-shield in front.

NOTE: If a car seat has a TOP ANCHOR STRAP, it must be fastened to a special anchor plate installed to the rear or to a set of rear lap belts. If you cannot or are not willing to do this, buy a car seat which is anchored only by a lap belt. Correctly used, a top anchor strap gives important extra protection for your child.

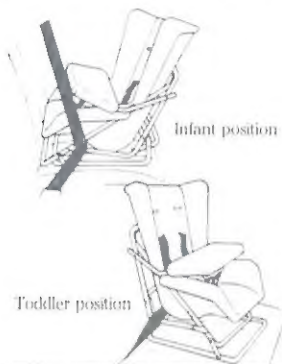

**Approved by Federal Aviation Administration for use on private and commercial aircraft.*

Restraint Designs are Varied

Some restraints use two or more of these features:

Infant Shell. The baby rides facing rearward, held by a harness. The carrier is secured by an auto lap belt.

Convertible. This can be used for either rear-facing for infants or forward-facing for toddlers who can sit up by themselves. Infants and toddlers are held in place with a harness; the seat is anchored with a lap belt.

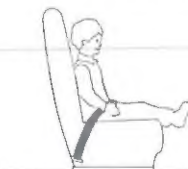

Car Seat. Child is held by a harness (shoulder, lap, and crotch straps). Seat held by auto lap belt. Some require a top anchor strap. Check possible installation problems for your car before buying.

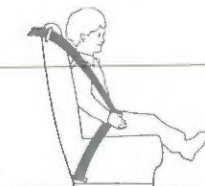

Booster Seat. Offers good restraint at low cost. Secured with auto lap belt and top anchor.

Auto Lap Belt. For children 40-55 inches tall. Belts should fit over hips. May require booster.

Seat/Shoulder Auto Belt. For child 55 inches and taller. Shoulder strap should go across chest; lap belt over hips.

Car Seat Rental Sites

These restraint devices are for rent at a very reasonable rate. For information, call the rental site in your area listed below.
